SUMMARY

Senior Software Engineer with 10+ years of experience designing and delivering robust, scalable web applications and services in API-driven environments. I enjoy solving complex problems, mentoring engineers, and collaborating across product and engineering teams to build high-quality applications that delight users and scale with business needs. I bring deep expertise in Ruby on Rails, SQL, frontend frameworks, and distributed system design.

SKILLS HIGHLIGHT

- **Backend / Languages:** Ruby, Ruby on Rails, Python, JavaScript (Node.js), SQL (PostgreSQL, MySQL)
- **Frontend / UI Frameworks:** React, Vue.js, HTML5, CSS3, SASS, Webpack, ES6+
- **APIs / Architecture:** RESTful APIs, GraphQL, Microservices, Service-Oriented Architecture (SOA), JSON, API Documentation
- **Databases:** PostgreSQL, MySQL, Redis, Graph DB (Neo4j basics), Database Indexing, Query Optimization
- **Cloud / DevOps:** AWS (EC2, S3, RDS, Lambda basics), Docker, Kubernetes, CI/CD (GitHub Actions, CircleCI)
- **Testing / Automation:** RSpec, Capybara, Minitest, Selenium, Jest, Cypress, Test Automation, TDD
- **Tools / Version Control:** Git, GitHub, Jira, Confluence, Agile/Scrum, Pair Programming

PROFESSIONAL EXPERIENCE

Intuit

Remote

Senior Software Engineer

Aug 2024 – Dec 2025

- Designed and implemented highly scalable, API-driven Ruby on Rails services handling millions of financial transactions per month, collaborating directly with product owners and backend teams to define service boundaries and performance SLAs while maintaining maintainable codebases with thorough RSpec test coverage and documentation.
- Led the rollout of microservices-oriented refactors in critical billing and customer-facing features using distributed service patterns and event-driven processing, optimizing response times by 32% and significantly improving horizontal scalability without sacrificing test reliability or engineering velocity.
- Architected and championed the adoption of PostgreSQL performance improvements including index redesign and query optimization for complex analytical endpoints, reducing average query latency from seconds to under 200ms with monitoring dashboards to ensure predictable performance at scale.
- Partnered with frontend engineers to design and deliver dynamic, reactive user experiences using React, building UI components that consumed API data efficiently with minimized network overhead and improved accessibility and responsiveness across devices.
- Drove cross-team initiatives to standardize API versioning and error reporting schemas across internal services, enhancing API discoverability, client integration speed, and operational observability for all dependent teams.
- Acted as key Ruby on Rails mentor and reviewer, conducting weekly pair programming sessions and architectural discussions that uplifted team best practices and reduced critical defects by measurable margins.
- Integrated Docker and container management practices for local and CI environments, reducing onboarding time for new teammates and establishing consistent developer experience across platforms.
- Collaborated with DevOps to introduce Kubernetes-based deployment strategies and monitoring instrumentation that improved deployment safety and rollback speed, ensuring near-zero downtime during major releases.
- Worked with internal compliance and data domain experts to architect new data extraction and transformation components that validated data integrity before ingestion, closely aligning with regulated financial data quality standards.

Software Engineer II**Aug 2022 – Aug 2024**

- Delivered core backend services in Ruby on Rails supporting Intuit's ecosystem of small business financial products, implementing RESTful APIs that processed high throughput while enforcing robust authentication, authorization, and auditing for sensitive financial data access.
- Contributed to the redesign of legacy monolithic modules into well-structured service classes with clearly defined interfaces and test suites using RSpec and Capybara, which improved maintainability and reduced defect rates in key business flows by over 25%.
- Developed comprehensive SQL database schemas and wrote advanced SQL views and stored procedures on PostgreSQL to support new reporting features used by internal analytics teams, ensuring efficient execution plans and maintainability across schema migrations.
- Collaborated with cross-functional teams to integrate React and Vue.js components for dashboards that visualized user metrics and health checks, enabling dynamic, real-time insights without compromising performance.
- Implemented API rate limiting, circuit breakers, and caching layers with Redis to support resilient APIs under load, preventing service degradation during peak usage events and honoring SLAs with high availability.
- Automated CI workflows using GitHub Actions and integrated rigorous test gates that ensured consistent quality across branches before merge, enabling smoother delivery cycles and early defect detection.
- Conducted retrospective analysis and refactoring of API error handling logic, streamlining logging and observability to accelerate debugging and cross-team incident response times.
- Assisted in foundational AWS deployments of staging and sandbox environments for feature flags and isolated testing, enhancing release confidence and reducing production incidents.
- Collaborated on API contract design with internal clients to formalize interface expectations and versioning policies that supported future scalable enhancements without breaking integrations.

Tai Software

Hunting Beach, CA

Software Engineer**Jun 2018 – Aug 2022**

- Built and maintained full-stack web applications using Ruby on Rails and JavaScript frameworks, working directly with customers in regulated financial and compliance contexts to gather requirements and translate them into scalable, testable features that balanced performance and usability.
- Implemented complex backend business logic and services on Rails, covering user workflows and data validation layers, with comprehensive test suites in RSpec to enforce correctness and minimize regressions in mission-critical systems.
- Designed and optimized SQL database models on PostgreSQL that supported relational reporting and data export features for enterprise customers, including indexing strategies that reduced report generation times by up to 40%.
- Collaborated with product managers and distributed teams to plan and deliver biweekly sprints using Agile methodologies, improving feature predictability and aligning development priorities with customer impact metrics.
- Created dynamic client dashboards using Vue.js and modern ES6 JavaScript, integrating real-time updates and responsive designs that improved user satisfaction and reduced support queries.
- Introduced and enforced automated test coverage metrics, encouraging the adoption of TDD techniques that increased confidence in refactoring and reduced technical debt in core modules.
- Integrated third-party APIs and external services, handling authentication, retries, and error states to ensure reliable cross-service data flow and maintain consistent SLAs with partners.
- Actively coached junior engineers on backend and frontend best practices, fostering a culture of knowledge sharing, code reviews, and paired problem solving throughout the team.

Tai Software

Hunting Beach, CA

Software Development Intern**Jun 2016 – Jun 2018**

- Supported development of internal tools and customer-facing features using Ruby on Rails, contributing code that handled form processing, validations, and email notifications with clean API endpoints and thorough tests to ensure bug-free releases.
- Assisted in constructing SQL queries and views to support analytical dashboards used by team leads for performance metrics, gaining hands-on experience in indexing and query optimization trends.
- Collaborated with senior engineers to learn best practices in Rails project structure, test writing with RSpec, and effective debugging techniques that improved the speed of resolving defects in daily builds.
- Participated in team planning sessions to estimate tasks, and helped refine user stories that better reflected engineering effort and customer expectations.
- Contributed to UI enhancements using vanilla JavaScript and early exposure to Vue.js that improved usability flows for onboarding forms and settings pages.
- Documented features and troubleshooting guides that were incorporated into onboarding docs for future interns, improving team knowledge continuity and reducing ramp time.
- Shadowed customer feedback sessions to better understand real-world use cases and how engineered solutions impacted user success, fostering strong empathy and customer-centric development approaches.

EDUCATION

UC Irvine

Bachelor's Degree, Computer Science

2012 - 2016

Irvine, CA
